| <b>Office Action Summary</b> | <b>Application No.</b><br>10/585,465 | <b>Applicant(s)</b><br>YAMAMOTO ET AL. |  |
|                              | <b>Examiner</b><br>Dmitriy Bolotin   | <b>Art Unit</b><br>2629                |  |

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 17 September 2009.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-14 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-14 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

It would be of great assistance to the Office if all incoming papers pertaining to a filed application carried the following items:

1. Application number (checked for accuracy, including series code and serial no.).
2. Group art unit number (copied from most recent Office communication).
3. Filing date.
4. Name of the examiner who prepared the most recent Office action.
5. Title of invention.
6. Confirmation number (See MPEP § 503).

### ***Status of Claims***

1. **Claims 1 – 14** are pending.

### ***Response to Arguments***

2. Applicant's arguments filed on 09/17/2009 have been fully considered but they are not persuasive.

3. As to Applicant's argument that Ohba fails to teach or suggest "means for executing predetermined processing when the detecting means detects the virtual touches that are made to a predetermined number of touch points in a predetermined order," the Examiner respectfully disagrees. In fact, Ohba does disclose means for executing predetermined processing (CPU 10 of fig. 2 executes a determined process when a certain process determining image is selected, [0071]) when the detecting means detects the virtual touches (the amount of movement of operators hand in a

Art Unit: 2629

particular area, [0069]) that are made to a predetermined number of touch points in a predetermined order (as shown in fig. 7, the menu image has a hierarchic structures, so in order to select "process22", the user has to perform virtual touches in the following order: first "menu" then "select2" and then "process22", [0070]).

4. As to Applicant's argument that Ohba fails to teach or suggest that "the analyzing means analyzes the video image when each of the plurality of images, that prompts the input, is displayed, and detects that an area of the video image, corresponding to the selected area displayed in the manner different from others, includes a predetermined image; and a predetermined function is executed when production of the image that prompts the input, and the detection that the corresponding area includes the predetermined image, are performed a predetermined number of times," the Examiner respectfully disagrees. In fact, Ohba does disclose that the analyzing means (difference value detector 107 of fig. 4) analyzes the video image when each of the plurality of images (each menu of hierarchic structure, [0070]), that prompts the input, is displayed (the difference value calculated is indicative of one movement of operator's hand in the area in which the menu image is displayed, [0073]), and detects that an area of the video image, corresponding to the selected area displayed in the manner different from others (the difference is represented by change in color or the gradation of transparency, [0075]), includes a predetermined image (when cumulative sum exceeds threshold, controller determines that menu item has been selected, [0076]); and a predetermined function is executed (CPU executes determined process, [0071]) when

Art Unit: 2629

production of the image that prompts the input, and the detection that the corresponding area includes the predetermined image, are performed a predetermined number of times (as shown in fig. 7, in order to execute “process22” the user has to go through hierarchical menu in following order: first “menu” then “select2” and then “process22”, therefore the detection of touch has to be performed at least three times).

5. As to Applicant’s argument that Ohba does not teach or suggest determining whether or not movements according to a predetermined order in a plurality of points are detected, and displaying one point among a plurality of points in a manner different from others (in order to indicate a point to be touched next), the Examiner respectfully disagrees. In fact, Ohba does disclose determining whether or not movements according to a predetermined order in a plurality of points are detected (as shown in fig. 7, in order to execute “process22” the user has to go through hierarchical menu in following order: first “menu” then “select2” and then “process22”, therefore the detection of touch has to be performed at least three times), and displaying one point among a plurality of points in a manner different from others (the difference is represented by change in color or the gradation of transparency, [0075]), and it is Nakamura who discloses displaying one point among a plurality of points in a manner different from others in order to indicate a point to be touched next (such as monkey reply game disclosed in Nakamura, col. 30, lines 50 – 56).

Art Unit: 2629

6. As to Applicant's argument that Nakamura does not teach or suggest displaying touch points connected sequentially subjected to the virtual touches, the Examiner respectfully disagrees. Ohba is the one who discloses detecting virtual touches using a camera, the reference of Nakamura is used to only show sequential connection of touch points, and it is the combination of these two references that would have been obvious to one of ordinary skill in the art at the time of the invention to teach applicant's claimed invention.

***Claim Rejections - 35 USC § 102***

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

8. **Claims 1, 3, 6 – 8** are rejected under 35 U.S.C. 102(b) as being anticipated by Ohba (US 2002/0097247).

As to **claim 1**, Ohba discloses an information processing system, comprising: means for producing a computer image (image processor 2 of fig. 2, [0068]) that prompts a player to virtually touch a plurality of touch points (a menu comprising layers of pull down menus shown in fig. 7, [0070]); means for accepting input of a video image of the player (image input device 101 of fig. 3) picked up by image pickup means (video camera 1 of fig. 1); display control means for superimposing the video image and the computer image on one another and causing a display device to display a

superimposed image (superimposing image generator 106 of fig. 3); means for analyzing the video image during display of the computer image (difference value detector 107 of fig. 3) and detecting a virtual touch to any of the plurality of touch points (object controller 105 determines touch [0075]); and means for executing predetermined processing (CPU 10 of fig. 2, [0070]) when the detecting means detects the virtual touches that are made to a predetermined number of touch points in a predetermined order (when appropriate process is selected from a pull-down menu, [0070]).

As to **claim 3** (dependent on 1), Ohba discloses the information processing system wherein: the image producing means sequentially produces computer images (menu items shown in fig. 7, [0070]) including navigation information indicating one touch point to be touched next (such as one SELECT point or PROCESS point of fig. 7); and the means for executing predetermined processing executes the predetermined processing (CPU 10 executes determined process, [0071]) when the detecting means detects that the virtual touches have been made for the respective computer images including the navigation information that is sequentially produced [0070 – 0071].

As to **claim 6**, Ohba discloses an entertainment system, comprising: means for producing a computer image including an image for specifying a plurality of areas (image processor 2 of fig. 2); means for accepting input of a video image (image input device 101 of fig. 3) picked up by image pickup means (camera 1 of fig. 1); display

Art Unit: 2629

control means for superimposing the video image and the computer image on one another and causing a display device to display a superimposed image (superimposing image generator 106 of fig. 3); and means for analyzing the video image by referring to the computer image (difference value detector 107 of fig. 3), wherein: the image producing means selects one area of the plurality of areas in a predetermined order (menu area of fig. 7), and sequentially produces a plurality of images (SELECT1, SELECT2 and SELECT3 of fig. 7) each of which prompts the input [0070] and is obtained by displaying the selected area in a manner different from others (one of the SELECT images is highlighted when selected, [0070]); the analyzing means analyzes the video image when each of the plurality of images, that prompts the input, is displayed, and detects that an area of the video image, corresponding to the selected area displayed in the manner different from others, includes a predetermined image (the object controller determines the color of menu image according to the difference value, [0070 – 0071 and 0075 – 0076]); and a predetermined function is executed when production of the image that prompts the input, and the detection that the corresponding area includes the predetermined image, are performed a predetermined number of times (as shown in fig. 7, the user has to go through nested menu by pressing at least three touch point in order for a process to execute, [0070 – 0071]).

As to **claim 7**, Ohba discloses an information processing system input accepting method, comprising: producing a computer image that prompts a player to virtually touch a plurality of touch points (producing nested menu shown in fig. 7); accepting

Art Unit: 2629

input of a video image of the player (using image input device 101 of fig. 3) picked up by image pickup means (camera 1 of fig. 1); analyzing the video image (using difference value detector 107 of fig. 3) while superimposing the video image and the computer image on one another (using superimposing image generator 106 of fig. 3) and causing a display device to display a superimposed image (using display controller 108 of fig. 3), and sequentially detecting virtual touches to any of the plurality of touch points (sequentially touching nested menu shown in fig. 7, [0070]); and accepting the virtual touches as predetermined input when a predetermined number of touch points are touched in a predetermined order by the virtual touches (as shown in fig. 7, the user has to go through nested menu by pressing at least three touch point in order for a process to execute, [0070 – 0071]).

As to **claim 8**, Ohba discloses a recording medium (28 of fig. 2) on which a computer program for accepting input is recorded, the computer program causing a computer to execute processing of: producing a computer image that prompts a player to virtually touch a plurality of touch points Ohba; accepting an input of a video image of the player (using image input device 101 of fig. 3) picked up by image pickup means (camera 1 of fig. 1); analyzing the video image (using difference value detector 107 of fig. 3) while superimposing the video image and the computer image on one another (using superimposing image generator 106 of fig. 3) and causing a display device to display a superimposed image (using display controller 108 of fig. 3), and sequentially detecting virtual touches to any of the plurality of touch points (sequentially touching

Art Unit: 2629

nested menu shown in fig. 7, [0070]); and accepting the virtual touches as predetermined input when a predetermined number of touch points are touched in a predetermined order by the virtual touches (as shown in fig. 7, the user has to go through nested menu by pressing at least three touch point in order for a process to execute, [0070 – 0071]).

### ***Claim Rejections - 35 USC § 103***

9. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

10. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 2629

11. **Claim 2** is rejected under 35 U.S.C. 103(a) as being unpatentable over Ohba in view of Lee et al. (US 6,160,899).

As to **claim 2** (dependent on 1), Ohba discloses the information processing system, wherein the detecting means detects the virtual touch when an object within the video image overlaps any one of the plurality of touch points within the computer image [0070 – 0071].

Ohba fails to disclose that virtual touch is detected when an object having a specific color and worn by the player.

In the same field of endeavor, Lee discloses detecting virtual touch when an object is worn by the player (ring of fig. 4A, col. 4, and lines 3 – 8).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate an object worn by the player in to the system of Ohba, so as to avoid erroneous recognition (Lee, col. 3, lines 63 – 67)

Ohba in vie of Lee do not disclose the object worn by the player having a specific color. However, it would have been obvious to one of ordinary skill in the art at the time of the invention to associate a specific color with the ring object of Ohba in view of Lee, since Lee discloses that the system can also detect the color, such as flesh color (Lee, col. 3, lines 23 – 33).

Art Unit: 2629

12. **Claim 9 – 14** are rejected under 35 U.S.C. 103(a) as being unpatentable over Ohba in view of Nakamura et al. (US 7,331,856).

As to **claim 4** (dependent on 1), Ohba discloses the information processing system, wherein: the image producing means (image processor 2 of fig. 2) sequentially produces computer images (nested menu of fig. 7); and the means for executing predetermined processing (CPU 10 of fig. 2) executes the predetermined processing when the detecting means detects that the virtual touches have been made [0070 – 0071] for the respective computer images including the navigation information that is sequentially produced (nested menu of fig. 7).

Ohba fails to disclose an image each indicating two touch points to be touched next and detecting virtual touches have been made simultaneously on the two touch points.

In the same field of endeavor, Nakamura discloses an image each indicating two touch points to be touched next (when a plurality of players present) and detecting virtual touches have been made simultaneously on the two touch points (col. 25, line 55 – col. 26, line 3).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a plurality of users of the system.

As to **claim 5** (dependent on 1), Ohba discloses the information processing system, wherein: the image producing means (image processor 2 of fig. 2) produces the computer image including navigation information (nested menu of fig. 7); and the means for executing predetermined processing (CPU 10 of fig. 2) executes the predetermined processing when the detecting means detects that the virtual touches have been made according to the navigation [0070 – 0071].

Ohba fails to disclose navigation information indicating an order of touches to be made to the touch points

In the same field of endeavor, Nakamura discloses navigation information indicating an order of touches to be made to the touch points (col. 30, lines 50 – 56).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

As to **claim 9**, Ohba discloses an information processing system, comprising; means for producing a computer image that prompts a player to virtually touch a plurality of touch points (image processor 2 of fig. 2); means for accepting an input of a video image of the player (image input device 101 of fig. 3) picked up by image pickup means (camera 1 of fig. 1); display control means for superimposing the video image and the computer image on one another and causing a display device to display a superimposed image (superimposing image generator 106 of fig. 3); means for

Art Unit: 2629

analyzing the video image during display of the computer image and detecting virtual touches to any of the plurality of touch points (difference value detector 107 of fig. 3); and the detecting means detects the virtual touches that are made sequentially to a predetermined number of touch points in a predetermined order (as shown in fig. 7, the user has to go through nested menu by pressing at least three touch point in order for a process to execute, [0070 – 0071]).

Ohba fails to disclose object displaying means for displaying an object that connects the touch points sequentially subjected to the virtual touches.

In the same field of endeavor, Nakamura discloses an object displaying means (operation device 80, col. 35, lines 32 – 43) for displaying an object that connects the touch points sequentially subjected to the virtual touches (a large arrow which connects points to be touched, col. 35, lines 32 – 43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

As to **claim 10** (dependent on 9), Ohba discloses the information processing system, wherein a virtual touch is made to any one of the touch points (menu points of fig. 7), but fails to disclose that the object displaying means displays the object that connects any one of the touch points to another touch point previously subjected to the virtual touch.

In the same field of endeavor, Nakamura discloses that the object displaying means (operation device 80 ) displays the object that connects any one of the touch points to another touch point subjected to the virtual touch (a large arrow which connects points, col. 35, lines 32 – 43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

Ohba in view of Nakamura fails to disclose another point is previously subjected to a virtual touch; however, it would have been an obvious design choice alternative to connect the touch points in any order and would require an artisan only a routine skill in the art.

As to **claim 11** (dependent on 9), Ohba discloses the information processing system, wherein the virtual touches are made to a predetermined number of touch points in a predetermined order [0070 – 0071], but fails to disclose the object displaying means displays the object that connects the touch points sequentially subjected to the virtual touches.

In the same field of endeavor, Nakamura discloses an object displaying means (operation device 80, col. 35, lines 32 – 43) for displaying an object that connects the touch points sequentially subjected to the virtual touches (a large arrow which connects points to be touched, col. 35, lines 32 – 43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

As to **claim 12** (dependent on 9), Ohba discloses the information processing system, but fails to disclose that the object that connects the touch points comprises a line imitating light.

In the same field of endeavor, Nakamura discloses that the object that connects the touch points comprises a line imitating light (an arrow on display inherently emits light, col. 35, lines 30 – 43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

As to **claim 13**, Ohba discloses a recording medium (28 of fig. 2) on which a computer program for accepting an input is recorded, the computer program causing a computer to function as: means for producing a computer image that shows a player a plurality of touch points to be virtually touched (image processor 2 of fig. 2); means for accepting input of a video image of the player (image input device 101 of fig. 3) picked up by image pickup means (camera 1 of fig. 1); display control means for superimposing the video image and the computer image on one another and causing a display device to display a superimposed image (superimposing image generator 106 of fig. 3); means for analyzing the video image during display of the computer image and

detecting virtual touches to any of the plurality of touch points (difference value detector 107 of fig. 3); and the detecting means detects the virtual touches that are made sequentially to a predetermined number of touch points in a predetermined order (as shown in fig. 7, the user has to go through nested menu by pressing at least three touch point in order for a process to execute, [0070 – 0071]).

Ohba fails to disclose object displaying means for displaying an object that connects the touch points sequentially subjected to the virtual touches.

In the same field of endeavor, Nakamura discloses an object displaying means (operation device 80, col. 35, lines 32 – 43) for displaying an object that connects the touch points sequentially subjected to the virtual touches (a large arrow which connects points to be touched, col. 35, lines 32 – 43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the computer program of Ohba to cause the computer to function according to features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

As to **claim 14**, Ohba discloses an input interface controlling method for an information processor having a computer image producing part, an image input part, a superimposed image producing part, and a determining part, the method comprising the steps of: producing, by the computer image producing part, a computer image that shows a player a plurality of touch points to be virtually touched (nested menu of fig. 7); accepting, by the image input part (image input device 101 of fig. 3), an input of a video

Art Unit: 2629

image of the player picked up by image pickup means (camera 1 of fig. 1); superimposing, by the superimposed image producing part (superimposing image generator 107 of fig. 3), the video image and the computer image on one another and causing a display device to display a superimposed image (using display controller 108 of fig. 3); analyzing, by the determining part, the video image during display of the computer image (using difference value detector 107 of fig. 3) and detecting virtual touches to any of the plurality of touch points [0070 – 0071].

Ohba fails to disclose displaying, by the computer image producing part, when the virtual touches are detected to have been made sequentially on a plurality of touch points, an object that connects the touch points sequentially subjected to the virtual touches.

In the same field of endeavor, Nakamura discloses displaying, by the computer image producing part (operation device 80, col. 36, line 40), when the virtual touches are detected to have been made sequentially on a plurality of touch points, an object that connects the touch points sequentially subjected to the virtual touches (trace of indicated positions, col. 36, lines 30 – 40).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device of Ohba to include features disclosed by Nakamura, so as to provide an interactive experience to a user of the system.

***Conclusion***

13. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dmitriy Bolotin whose telephone number is (571)270-5873. The examiner can normally be reached on Monday-Friday, 8:00 AM - 5:00 PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amare Mengistu can be reached on (571)272-7674. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

/D. B./  
Examiner, Art Unit 2629

/Amare Mengistu/  
Supervisory Patent Examiner, Art Unit 2629
